

Kry10 OT Network Guard

Inline, formally verified protocol defence for legacy OT

1. Vulnerability Evolution

How the OT vulnerability environment has evolved over the last 30 years

Mid 90s - 2000s

PLCs connected over isolated or private OT network

Business Priority:
Safety not security

Business Challenge:
Minimal metrics available from isolated networks

2000s - 2010s

OT Networks become networks become connected to the internet

Business Priority:
Management data, metrics and dashboards

2010s - Present Day

Threat actors access OT networks via the internet

PLC attacks and malware

Business Priority:
Maintaining service levels while under attack.

Business Challenge:
Certification and safety requirements make patching and cyber security challenging

2. Network Guard resolves the challenges

3. Threat Scenario

Attacker sends a malicious packet targeting a PLC vulnerability

- ✓ No network re-configuration
- ✓ No PLC recertification
- ✓ Legacy PLC remains unchanged
